

# BeachheadSecure® Phones & Tablets

## for iOS and Android

*Enforce encryption and retain remote data access control on vulnerable mobile devices*

The BeachheadSecure Management System is a single, configurable, web-based console with device modules that can be added in any mix or quantity for iPhone & iPads, Android devices, Windows & Mac PCs, USB storage devices and Windows Servers. This unique system allows you to remotely secure the vulnerable devices in your organization – whether through temporary quarantine or permanent data wipe.

### **Easily-managed encryption enforcement and remote access control**

Devices today are encrypted, but that's only helpful if the device is not authenticated. This makes it critical that you can still control password credibility (length, strength, frequency of change) and that the device reverts to its locked and encrypted state after a reasonable passage of time. BeachheadSecure gives you full control over these critical management elements and more. And, depending on your assessment of the severity of risk, you can determine whether to temporarily deny user access ("quarantine") or, under more extreme risks, wipe compromised data completely.

### **Engineered to be delivered through "the Cloud"**

and offered as a software-as-a-service ("SaaS") subscription, Beachhead's services were the first to market – even before the cloud and SaaS were fashionable. This web-managed approach has proven to be particularly pertinent given the proliferation of device types, operating systems and communication protocols that have moved ever further from corporate controls. With a Beachhead subscription, there is absolutely no software or network infrastructure to buy or support. Protection can be deployed over your entire inventory of mobile devices immediately through the cloud, providing company-wide protection in a matter of hours.

### **Configure to protect all or some of your mobile devices**

Beachhead's modular system allows you to choose which devices you need to protect. Do you need policy control and security for just tablets and phones? Easy! Get BeachheadSecure Phones & Tablets modules to add to your BeachheadSecure Control Panel. Need to encrypt and secure your inventory of Mac computers? No problem. Simply add BeachheadSecure Mac in the quantities for those devices. HIPAA regulations require you to encrypt your Windows PCs? With Beachhead's console, you can add BeachheadSecure PC modules as needed for your unique mix of mobile devices. The BeachheadSecure system is effective enough for company-owned devices, and unobtrusive enough for devices owned by employees.

### **The Right Security & Policy Control for Your Organization**

Beachhead subscriptions and services provide administrators with enhanced visibility and extremely easy-to-manage policy control for mobile data depositories, including your PCs, smartphones, tablets and USB storage. Now, all your endpoint data - wherever it may be - can be encrypted and secured with one powerful, centralized management console.
